

## ”... handhygiejne is also a part of our success!”

So states Ole Klitgård from Danish Property Restoration provider Dansk Bygningskontrol Nordjylland A/S, when asked about working conditions for their staff. Success - and growth - is two words that has been central for the company's development the past two years.

### From lokal to National service

”It is hard to pinpoint only a few factors that has contributed to our success – but we work hard at offering our employees good conditions – whether it being tools, organization, onsite handhygiene – and involvement in our common goals. It creates motivation for the employees and thereby happy customers.”

That the customers are happy, are evident from the growth of the company: Dansk Bygningskontrol has in few years expanded from one local company to an organization with national coverage with 11 subsidiaries and 250 employees. “And vi we are welcoming 50 more in the next couple of months.” Regional Manager Ole Klitgaard adds.

### From dirt and soil to sewer water and dead rats.

In the Property Restoration industry, you never know what to expect - and Danish Building Control has a committee constantly scanning for new equipment and tools to secure and enable employees in every conceivable situation; From vehicles specially fitted for disposal of e.g. asbestos, to special gloves, helmets and hand hygiene or what might be needed when you reach a fire, a sewer that has crossed its width, or you have to clean a home after a death.

For sudden damage, an extremely well-equipped van is essential to ensure that you can carry out all the tasks on the spot.

### Water and soap...

We have always used a combination of handrub and paper. But it is clear that a real wash with water, soap and paper before disinfecting your hands is optimal, " Ole Klitgaard explains -" and ShoulderSink just made it a lot easier to bring along"

With ShoulderSink, staff at Dansk Bygningskontrol now have easy access to Soap, Water, Paper and Hand Spray - also without cross-contaminating the tap trying to turn it on with dirty hands. The tap is tilted down with the arm, as in the hospitals. The unit sits right inside the door, but can also easily be brought along.

"And besides from the fact that it is healthier, there is also something positive psychologically by using water and soap - it simply gives a better sense of wellbeing after a dirty project" Ole Klitgaard concludes.
